

PRESS RELEASE - - - Scottsboro, Alabama, October 31, 2007

Innovative Signals Technology (ISigTech) announces the release of **ENCORE** – a miniature, programmable multi-channel Software-Defined Radio (SDR) wideband collection system for targeting wireless communications such as GSM, CDMA, Trunked Mobile Radio (TMR), Push-To-Talk (PTT), etc. ENCORE represents a cost effective, high quality alternative to proprietary, legacy collection systems that have saturated the intelligence market. ENCORE is the second product released under ISigTech's **KODIAK Tactical Intelligence Suite**.

Comprised of 100% COTS hardware and an open API for third party software development, ENCORE provides multi-band coverage (HF/VHF/UHF) up to 2.4GHz with configurable instantaneous output bandwidth. Wideband and narrowband operations are all implemented in software to provide flexibility and scalability. ISigTech has leveraged its KODIAK product – a robust signal processing, analysis and data management application – for the command and control interface for ENCORE. Wideband recording and visualization are embedded within ENCORE as well as control of the narrowband software DDR channels. By leveraging KODIAK, ENCORE equips customers with the open architecture they deserve. Customers may develop their own signal processing modules or merge in existing capabilities as they see fit. ENCORE is ideal for wideband survey and sustained collection missions as well as target development.

About Innovative Signals Technology:

Innovative Signals Technology, LLC (ISigTech) designs and develops state-of-the-art software and hardware products for the Signals Intelligence (SIGINT) market. ISigTech is comprised of engineering and business professionals dedicated to revolutionizing tactical SIGINT production. We are technical and operational experts in the areas of data acquisition, signal processing, signals analysis, and information assurance. Information about Innovative Signals Technology is available at www.isigtech.com.
